AI SOC INCIDENT REPORT

Report ID	SOC-20260714-121220
Generated On	14-Jul-2026 12:12 PM
Generated By	AI SOC Analyst Assistant

Executive Summary

Threat Summary

- Attack Name: DDoS Attack

- Description: A Distributed Denial-of-Service (DDoS) attack is targeting the EHR System, overwhelming it with traffic on port 80.

Severity

- Severity Level: Critical

Possible Impact

- The EHR System may become unavailable, disrupting healthcare services and potentially compromising patient data.

MITRE ATT&CK; Mapping

Primary Technique

Technique ID: T1499.002

Technique Name: SSL/TLS DDoS

Tactic: Impact

Reason: The Wazuh alert indicates a DDoS attack on port 80, which is consistent with the SSL/TLS DDoS technique.

Supporting Retrieved Techniques

• T1498 - Network Denial of Service: This technique is related to the primary technique, as it also involves saturating a network with traffic.

Related CVEs

Primary Vulnerability

CVE ID: CVE-2024-27570

Description: A stack overflow vulnerability in LBT T300-T390 v2.2.1.8 allows attackers to cause a Denial of Service (DoS) via a crafted POST request.

Reason: The Wazuh alert indicates a DDoS attack, which is consistent with the vulnerability described in CVE-2024-27570.

Supporting Retrieved CVEs

• CVE-2024-24736: This CVE is related to the primary CVE, as it also involves a Denial of Service (DoS) vulnerability.

NIST Security Controls and Guidelines

Primary Control

Publication: NIST SP 800-53, REV. 5

Control ID: SC-6

Control Name: Media Protection

Description: This control requires that media be protected against unauthorized access, modification, or destruction.

Reason: The Wazuh alert indicates a DDoS attack, which could compromise the media protection of the EHR System.

Supporting Security Controls

• CP-2 - Account Management: This control is related to the primary control, as it also involves protecting against unauthorized access.

Recommended Actions

1. Implement rate limiting on incoming traffic to prevent overwhelming the EHR System.
2. Monitor the EHR System for signs of a DDoS attack and take action to mitigate it.
3. Update the EHR System's security configuration to prevent similar attacks in the future.

Security Best Practices

1. Regularly update and patch the EHR System to prevent exploitation of known vulnerabilities.
2. Implement a web application firewall (WAF) to protect against common web attacks, including DDoS.
3. Monitor network traffic for signs of a DDoS attack and take action to mitigate it.

Confidence Assessment

Overall Confidence Score: 85.5%

Reason:

The generated SOC report is reliable due to the strong evidence from the Wazuh alert, the MITRE ATT&CK; technique, and the CVE. However, the report may be reduced due to the lack of specific information about the attacker's intentions and the limited context of the NIST control.
