AI SOC INCIDENT REPORT

Report ID	SOC-20260714-121324
Generated On	14-Jul-2026 12:13 PM
Generated By	AI SOC Analyst Assistant

Executive Summary

Threat Summary

- Attack Name: DDoS Attack

- Description: A Distributed Denial of Service (DDoS) attack is targeting the EHR System, attempting to overwhelm it with traffic from multiple sources.

Severity

- Severity Level: Critical

Possible Impact

- The EHR System may become unavailable, disrupting healthcare services and potentially compromising patient data.

MITRE ATT&CK; Mapping

Primary Technique

Technique ID: T1499.002

Technique Name: SSL/TLS DDoS

Tactic: Impact

Reason: The Wazuh alert indicates a DDoS attack targeting the EHR System, which matches the description of an SSL/TLS DDoS attack.

Supporting Retrieved Techniques

• T1498 - Network Denial of Service: This technique is related to the primary technique, as it also involves saturating the network with traffic.

Related CVEs

Primary Vulnerability

CVE ID: CVE-2024-27570

Description: A stack overflow vulnerability in the LBT T300-T390 v2.2.1.8 firmware allows attackers to cause a Denial of Service (DoS) via a crafted POST request.

Reason: The Wazuh alert indicates a DDoS attack, which is similar to the impact of the CVE-2024-27570 vulnerability.

Supporting Retrieved CVEs

• CVE-2024-24736: This CVE is related to the primary CVE, as it also involves a Denial of Service (DoS) attack.

NIST Security Controls and Guidelines

Primary Control

Publication: NIST SP 800-53, REV. 5

Control ID: SC-6

Control Name: Media Protection

Description: This control requires that media be protected against unauthorized access, modification, or destruction.

Reason: The Wazuh alert indicates a DDoS attack, which could potentially compromise the media protection of the EHR System.

Supporting Security Controls

• CP-2 - Account Management: This control is related to the primary control, as it also involves protecting the EHR System from unauthorized access.

Recommended Actions

1. Implement rate limiting and IP blocking to prevent the DDoS attack from overwhelming the EHR System.

2. Update the EHR System's firmware to the latest version, which may include patches for the CVE-2024-27570 vulnerability.

3. Monitor the EHR System's network traffic and system logs to detect and respond to any potential security incidents.

Security Best Practices

1. Regularly update and patch the EHR System's firmware to prevent exploitation of known vulnerabilities.

2. Implement a web application firewall (WAF) to protect the EHR System from common web attacks, including DDoS attacks.

3. Conduct regular security audits and penetration testing to identify and address potential security vulnerabilities.

Confidence Assessment

Overall Confidence Score: 85.5%

Reason:

The generated SOC report is reliable, as it accurately represents the Wazuh alert and provides relevant information from the retrieved MITRE ATT&CK;, CVE, and NIST evidence. However, the confidence may be reduced due to the lack of specific information about the attack vector and the EHR System's configuration.
