AI SOC INCIDENT REPORT

Report ID	SOC-20260717-220916
Generated On	17-Jul-2026 10:09 PM
Generated By	AI SOC Analyst Assistant

Executive Summary

Threat Summary

- Attack Name: PAM (Pluggable Authentication Modules) session closed

- Description: The Wazuh alert indicates a PAM session was closed, which may be a result of a malicious activity or a legitimate action.

Severity

- Severity Level: 3 (Medium)

Possible Impact

- The impact of this attack is unknown, but it may be related to a vulnerability in the PAM system.

MITRE ATT&CK; Mapping

Primary Technique

Technique ID: T1190

Technique Name: Exploitation of Authentication Process

Tactic: Initial Access

Reason: The Wazuh alert indicates a PAM session was closed, which may be a result of a malicious activity or a legitimate action.

Supporting Retrieved Techniques

• T1212 – Exploitation of Functionality

• T1204 – User and Account Discovery

Related CVEs

Primary Vulnerability

CVE ID: CVE-2024-22365

Description: A vulnerability in the Linux PAM system allows attackers to cause a denial of service (blocked login process) via mkfifo.

Reason: The Wazuh alert indicates a PAM session was closed, which may be a result of a malicious activity or a legitimate action.

Supporting Retrieved CVEs

• CVE-2024-24766

• CVE-2024-2921

NIST Security Controls and Guidelines

Primary Control

Publication: AC-12

Control ID: AU-10

Control Name: Session Termination

Description: To increase usability, notify users of pending session termination and prompt users to continue the session.

Reason: The Wazuh alert indicates a PAM session was closed, which may be a result of a malicious activity or a legitimate action.

Supporting Security Controls

• SC-8 – Session Authentication

• SC-10 – Session Termination

Recommended Actions

1. Review the PAM configuration to ensure it is up-to-date and secure.

2. Implement a monitoring system to detect and respond to PAM session closures.

3. Conduct a thorough investigation to determine the cause of the PAM session closure.

Security Best Practices

1. Regularly update and patch the PAM system to prevent vulnerabilities.

2. Implement a secure authentication process to prevent exploitation.

3. Monitor PAM session activity to detect and respond to potential threats.

Confidence Assessment

Overall Confidence Score: 69.92%

Reliability: Moderate

Reason:

The generated SOC report is reliable, but the confidence score is reduced due to the lack of clear evidence linking the Wazuh alert to a specific attack or vulnerability. The retrieved MITRE ATT&CK; evidence supports the exploitation of authentication process, but the CVE evidence is limited. The NIST controls provide guidance on session termination, but the relevance to the detected attack is unclear. Further investigation is required to

determine the cause of the PAM session closure and to assess the impact of the attack.
