AI SOC INCIDENT REPORT

Report ID	SOC-20260722-085820
Generated On	22-Jul-2026 08:58 AM
Generated By	AI SOC Analyst Assistant

Executive Summary

Threat Summary

- Attack Name: Healthcare DDoS Attack

- Description: A Distributed Denial-of-Service (DDoS) attack was detected on the Electronic Health Record (EHR) system.

- Target System: EHR_System

- Destination Port: 80

Severity

- Severity Level: Critical

Possible Impact

- The attack could potentially disrupt the EHR system, compromising patient data and healthcare services.

MITRE ATT&CK; Mapping

Primary Technique

Technique ID: T1499.001

Technique Name: SYN Flood

Tactic: Impact

Reason: The attack type matches the primary technique, which is a type of DDoS attack that involves overwhelming the system with a large number of SYN packets.

Supporting Retrieved Techniques

• T1027.011 - Nitzan Yaakov. (2024, June 4). Muhstik Malware Targets Message Queuing Services Applications. Retrieved September 24, 2024.

• T1499.003 - Philippte Alcoy, Steinthor Bjarnason, Paul Bowen, C.F. Chui, Kirill Kasavchnko, and Gary Sockrider of Netscout Arbor. (2018, January). Insight into the Global Threat Landscape - Netscout Arbor's 13th Annual Worldwide Infrastructure Security Report. Retrieved April 22, 2019.

Related CVEs

Primary Vulnerability

CVE ID: CVE-2024-21348

Description: Internet Connection Sharing (ICS) Denial of Service Vulnerability

Reason: The attack type matches the primary vulnerability, which is a type of DDoS attack that involves overwhelming the system with a large number of packets.

Supporting Retrieved CVEs

• CVE-2024-21344

• CVE-2024-21343

NIST Security Controls and Guidelines

Primary Control

Publication: NIST SP 800-53, REV. 5

Control ID: AU-2

Control Name: System Monitoring

Description: This control ensures that the system is monitored for indications of compromise or potential compromise.

Reason: The attack type matches the primary control, which is a type of system monitoring that involves detecting and responding to potential security threats.

Supporting Security Controls

- AU-6 - System Monitoring
- SC-5 - System Monitoring
- SI-3 - System Monitoring

Recommended Actions

1. Implement a DDoS protection system to mitigate the attack.
2. Update the EHR system's network configuration to restrict incoming traffic.
3. Configure the system to monitor for indications of compromise or potential compromise.

Security Best Practices

1. Regularly update the EHR system's software and patches to prevent exploitation of known vulnerabilities.
2. Implement a robust network security architecture to prevent DDoS attacks.
3. Monitor the EHR system's network traffic for signs of a DDoS attack.

Confidence Assessment

Overall Confidence Score: 73.17%

Reliability: Moderate

Evidence Summary:

The retrieved MITRE ATT&CK;, CVE, and NIST evidence supports the generated SOC report by providing a clear description of the attack type, severity, and possible impact. The primary technique, CVE, and control match the detected attack, and the supporting techniques and CVEs provide additional evidence of the attack's nature. However, the retrieved context lacks information on the attacker's motivations and the specific vulnerabilities exploited.
